---

A SPF (Sender Policy Framework) is a way to allow you to restrict which mail servers are allowed to send email for your domain name.

An example of an SPF would be : example.com. TXT "v=spf1 -all"

SPF records are TXT records placed into a domains DNS. To setup a SPF record we recommend using the following link:

<http://www.openspf.net/dns.html>

Please note, forwarding emails can sometimes break the SPF. If this is the case we recommend using SRS (Sender Rewriting Scheme). More information about this can be found here:

<http://www.openspf.net/SRS>

If the above links do not work please see <http://www.open-spf.org/Tools/>

\*\*\*\*\* Additional notes for Webservio customers:

If you are using Webservio Strata Mail email systems the SPF should be :

"v=spf1 a mx ip4:208.82.180.0/22 ip4:208.82.180.50 ip4:199.15.255.0/24 -all"
