Domain forwarding links your domain name to any web address, putting your domain name to immediate use. When using a domain name for a web site, we can forward people typing in www.your-name.com to your actual web site, wherever that may be. For example, if Example company has a free web site at http://www.aol.com/members/pages/Example/index.html, then Webservio can set up www.example.com to point to that web page.It is like call forwarding on your phone. A visitor just knows that they are at your web site, and it is invisible to them how they got there. If you want the web address in the address bar to remain www.your-name.com, please refer to domain aliasing.
