With this option you can enable periodic protection reports based on users. You can add users, either individually or via the .csv upload function for multiple users. Only ASCII characters are supported for the local part.

The PDF report outlines a summary of the spam and viruses that the filtering service has protected the domain (or address) from receiving, and also includes information about the total volume of mail processed for the said user.

The report also includes a detailed table (for auditing purposes) of messages that were rejected but not quarantined; A similar table is also included of messages that were quarantined, including links to release each message directly.

The option "Automatically activate for all recipient" means that when spam is delivered to new users not yet known to our systems, they will automatically be added to the Periodic User Report.
