If you are using the McAfee SaaS outbound filtering service and have a need for an SPF record on your domain, please use the record below as a starting point.

While all environments are different and you may require additional tokens, this record will authorize McAfee to send on behalf of your domain.

```
v=spf1 ptr include:mxlogic.net ~all
```

This should be placed in a TXT record within your DNS.

The example above will include all McAfee SaaS IP addresses as they exist or may change in the future. The tilde (~) can be changed to a dash (-) if you wish to inform recipients that invalid senders should be blocked.

If you already have an SPF record set up for your domain, you can simply add the statement `include:mxlogic.net` to the end of the SPF record, before the `all` token.

For example; if your current SPF record is this:

```
v=spf1 a ptr mx ip4:192.168.1.1 ~all
```

You would update it so that it reads as follows:

```
v=spf1 a ptr mx ip4:192.168.1.1 include:mxlogic.net ~all
```

For more information regarding SPF records please visit <http://www.openspf.org> or <http://www.microsoft.com/mscorp/safety/content/technologies/senderid/wizard/>.
