If you are going to use an FTP server for storing backup files, you should set up the control panel appropriately:
» Navigate to the repository you need:

» For a repository on your client level, go toÂ **Home**Â >Â **Backup Manager**Â >Â **Personal FTP Repository Settings.**
» For a repository on a domain level, go toÂ **Domains**Â >Â **domain name**Â >Â **Backup Manager**Â >Â **Personal FTP Repository Settings.**

» Specify the following settings:

» FTP server's IP address or host name.
» Directory on the server, where you want to store backup files.
» User name and password for access to the FTP account.

» ClickÂ **OK**.
If you do not have your own FTP repository we can provide one to you for an additional monthly fee.Â Our FTP servers are available onsite, off-server and some are offsite to a remote location.Â
